

In the first stage, the students filmed areas with waste in the city. The mapping results will be passed on to the planning department for further investigation and treatment.

Additionally:

1. We uploaded a TikTok video.
2. The student council, together with members of the elected committee, will conduct an activity on the topic "Take the garbage with you" for all the classes (around 350 students in junior high) in Tu Beshvat (5-6th of February).
3. An activity will be held for 30 elementary students.
4. An activity will be held in a senior center for 50 participants.
5. In the future, a cleaning explanation will be held in public centers to raise awareness among residents about the problem of leaving waste in public spaces. In addition, residents will be encouraged to keep the city clean. Parents' signatures will be collected during a parents' evening at the school. The goal is to get as many signatures as possible, at least 100.
6. A meeting will be held with the head of the education department and the city mayor for a signature on the project.
7. We met for a thinking group with parents, and a representative of the authority to propose ideas for expanding the campaign. In the thinking group, the students presented to the community representatives what they had done so far. The parents rated the students' proposals in two categories of feasible or not feasible.

An example of some of the ideas:

Placing bins in urban parks to encourage children to use them. Installing a waste sorting machine in commercial centers. Installing a machine in food centers that gives money for waste that the public brings to it.

Holding a meeting with the responsible person for the industrial area in the city to promote the waste management of business and factory owners, etc.

The chosen idea for implementation is raising awareness through an educational campaign using the network (the video on YouTube) and elementary activities. The reason this idea was chosen is because we agreed that education is the beginning and end of everything and if today's children are educated to think of waste as a resource that can be managed in a circular economy, they will grow up to be citizens who know how to manage properly, considering the environment for future generations.
