

Enriching local flora biodiversity

A forester who visited the school a few days earlier suggested what kinds of plants are suitable for planting on the school grounds in order to enrich biodiversity.

The school requested these plants from the Government Forestry Department and they were happy to donate all the plants we needed.

During a school assembly, a teacher spoke of the advantages of increasing biodiversity. The Mayor of the community and a representative of the government department that is responsible for schools were there to support our activities. The Mayor spoke to the students to express his support and congratulate them for their activities.

Actually the municipality helped us in more ways. A few days earlier people who are working for the maintenance of green spaces visited the school and opened holes so that planting would be easy.

All children of the school were responsible for planting and then caring for the plants they planted. Frequent watering is especially important in Cyprus.
